Building Surveyors

## Drones

EK Digital employs the latest aerial drone technology as a convenient and cost-effective method of inspecting residential and commercial premises, especially at high level.

## We are able to:

- Use **drones** to provide quick, safe and inexpensive access to elevated areas of buildings. Drones reduce the need to erect scaffolding and have removed the need for potentially inaccurate 'assumptions' within project plans.
- Provide **video and interactive surveys**, giving clients a running commentary of findings and potential solutions from behind a camera, allowing a virtual 'walk through' of a building. These can be provided faster, and digested more quickly and effectively than a bulging written report.
- Create **digital maps** allowing stakeholders to view properties and their surrounds with high levels of detail.
- Deliver **3D visualisations**, giving a real sense of space and perspective; saving difficult decisions and huge costs before contractors start work on a project.

## Building, Construction & Infrastructure Surveys

Using drones for surveying is becoming a recognised way of accessing elevated and high-risk areas. They're safer, more cost effective and have quicker lead times than traditional methods of access. Carrying out surveys and inspections with drones enables building and structures to be fully captured in high quality images or video. This can then be reviewed and analysed off-site.

## Measured Surveys & Mapping

Drones capture data to produce 3D models, accurate densified point clouds and geo-referenced orthomosaics. This allows you to measure, understand and manage your assets in an effective way.

## Filming & Photography

You need aerial photography & filming that showcases your assets in an effective way and grabs the attention of your chosen audience, enabling you to easily engage with them. Using drones for aerial filming & photography makes this achievable for projects of all sizes.
